

# FUT vs. FUE hair transplant

FUT and FUE both involve transplanting individual hair follicles. During FUT surgery, a surgeon cuts a strip of skin from the back or

side of your scalp and then extracts the hair follicles. In FUE surgery, your surgeon will remove individual hair follicles directly from your scalp, rather than first taking a strip of scalp skin.

FUE is currently the more common surgery. Some of

# the advantages of FUE

include:

- quicker healing time
- less pain after surgery
- doesn't cause a significant scar
- hair from other body parts can be used
- can be used even if you have poor hair density

Some advantages of FUT  
include:

- may be a better option if you need a large number of hair follicles grafted
- shorter operation time
- cheaper surgery
